Introduction

Application

Complete refrigeration appliance control with great flexibility to adapt to all types of refrigeration appliances and cold storage rooms.

Advantages

- · Energy optimisation of the whole refrigeration appliance
- One controller for several different refrigeration appliances
- · Integrated display at the front of the controller
- · Quick set-up with predefined settings
- Built-in data communication
- · Built-in clock function with power reserve

Principle

The temperature in the appliance is registered by one or two temperature sensors which are located in the air flow before the evaporator (S3) or after the evaporator (S4) respectively. A setting for thermostat, alarm thermostat and display reading determines the influence the two sensor values should have for each individual function.

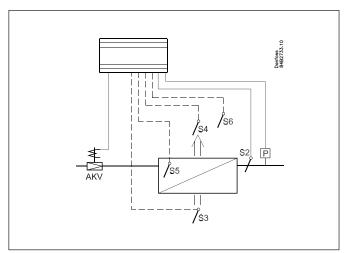

In addition product sensor S6, which can be optionally placed in the appliance, can be used to register the temperature near the required product in a certain place within the appliance.

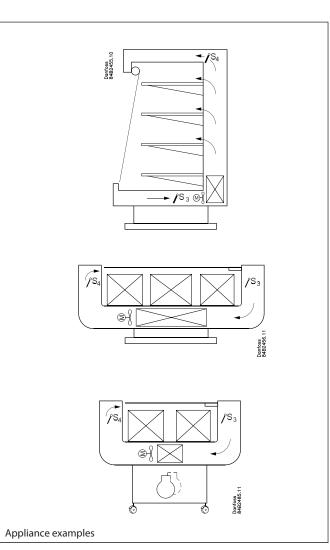

The temperature of the evaporator is registered with the S5 sensor which can be used as a defrosting sensor.

In addition to the outlet to the electronic injection valve of the type AKV, the controller has 5 relay outputs which are defined by the use selected – the individual usage options are described in detail on page 12.

Functions

- Day/night thermostat with ON/OFF or modulating principle
- Product sensor S6 with separate alarm limits
- Switch between thermostat settings via digital input
- Adaptive control of superheat
- Adaptive defrosting based on evaporator performance
- Start of defrost via schedule, digital input or network
- Natural, electric or hot gas defrost
- Stop of defrost on time and/or temperature
- Coordination of defrosting among several controls
- Pulsing of fans when thermostat is satisfied
- Case cleaning function for documentation of HACCP procedure
- · Rail heat control via day/night load or dew point
- · Door function
- Control of two compressors
- · Control of night blinds
- · Light control
- Heat thermostat
- Factory calibration that will guarantee a better measuring accuracy than stated in the standard EN 441-13 without subsequent calibration (Pt 1000 ohm sensor)
- Integrated MODBUS communication with the option of mounting a LonWorks communication card

Applications

Here is an overview of the controller's usage options.

A setting will configure input and outputs so that the controller's operation interface is directed at the selected application.

The current settings for the respective uses can be found on page 28.

Application 1-8

These uses are applied to standard appliances or cold storage rooms with one valve, one evaporator and one refrigeration section.

The sensors are used according to standard principles.

The output functions change depending on the selected application.

Application 9

This use is for refrigeration appliances with one valve, two evaporators and two refrigeration sections.

Here the temperature and alarm monitoring are always controlled using the S4 sensor.

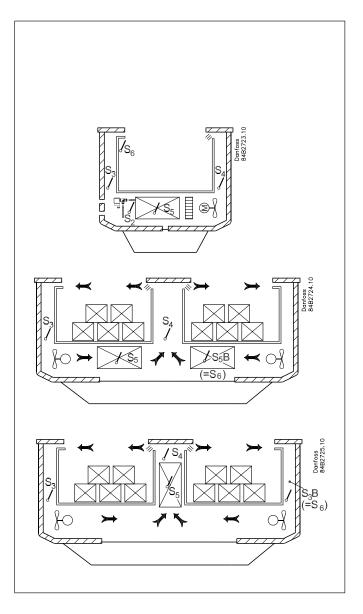

The S3 sensor is used for display readings.

The product sensor is replaced by an extra defrosting sensor S5B for the second evaporator.

Application 10

This use is for refrigeration appliances with one valve, one evaporator and two refrigeration sections.

Here temperature is always controlled using the S4 temperature. The S6 sensor is placed in the S3B position. The S3B sensor uses alarm limits, etc which are normally used for the S6 sensor. The two S3 temperatures are used for alarm monitoring and display readings for each refrigeration section. There are separate alarm limits for each refrigeration section.

Operation

Liquid injection

Liquid injection in the evaporator is controlled by an electronic injection valve of the type AKV. The valve functions as both expansion valve and solenoid valve. The valve opens and closes using signals from the controller.

The function contains an adaptive algorithm which independently adjusts the valve's opening so that the evaporator constantly supplies optimum refrigeration.

Superheat can be measured via one of the two following principles:

Pressure sensor P0 and temperature sensor S2
 For this use a correct measurement of superheat is achieved under all conditions which ensures a very robust and precise control.

The signal from one pressure transmitter can be used by several controllers, but only if there is no significant pressure difference between the evaporators in question.

• Two temperature sensors S1 and S2
Use of the S1 sensor means that location is particularly important. The sensor must be located so as to read the evaporating temperature during injection without the presence of too much pressure drop. Danfoss recommends that the S1 sensor be located on the first pipe bend on the evaporator.

Placement of the S1 sensor is crucial for a safety signal and with this a satisfactory control.

Temperature control

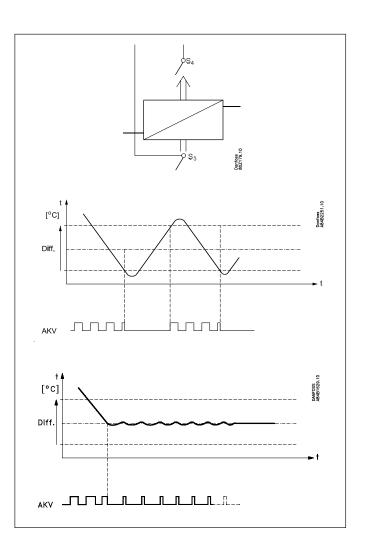

The temperature in the appliance is registered by one or two temperature sensors which are located in the air flow before the evaporator (S3) or after the evaporator (S4) respectively. A setting for the thermostat, alarm thermostat and display reading determines how much the two sensor values should influence each individual function, e.g. 50% will produce an equal value from both sensors.

The actual temperature control can take place in two ways: as an ordinary ON/OFF regulation with a differential, or as a modulating control there the temperature variation will not be nearly as great as in ON/OFF control. There is however a limit to the use of a modulating control as it can only be used in central plant. In a decentralised plant the thermostat function with ON/OFF control should be selected.

In a central plant the thermostat function may either be selected for ON/OFF control or modulating control.

Temperature monitoring

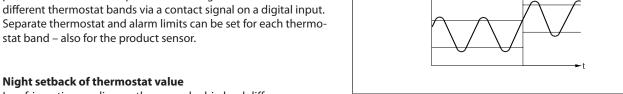

Just as is possible for the thermostat, the alarm monitoring can be set with a weighting between S3 and S4 so that you can decide how much the two sensor values should influence the alarm monitoring. Minimum and maximum limits can be set for alarm temperature and time delays. A longer time delay can be set for high temperature alarms after defrosting, appliance cleaning or start-up.

Thermostat bands

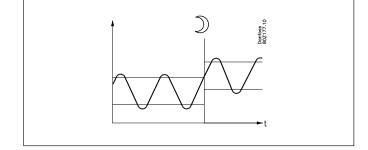

Thermostat bands can be used beneficially for appliances where different product types are stored which require different temperature conditions. It is possible to change between the two different thermostat bands via a contact signal on a digital input. Separate thermostat and alarm limits can be set for each thermostat band - also for the product sensor.

In refrigeration appliances there may be big load differences between the shop's opening and closing hours, especially if night lids/blinds are used. The thermostat reference may be raised here without it having any effect on the product temperature. Change-over between day and night operation can take place, as follows:

• via a signal from the data communication system.

Product sensor

A separate optional product sensor S6, which may be placed in the appliance, can also be used and which can register and monitor the temperature in the warmest part of the appliance. There are separate alarm limits and time delays for the product sensor.

Appliance cleaning

This function makes it easy for the shop's staff to carry out a cleaning of the appliance according to a standard procedure. Appliance cleaning is activated via a signal – as a rule via a key switch placed on the appliance.

Appliance cleaning is carried out via three phases:

- 1 at the first activation the refrigeration is stopped, but the fans keep on operating in order to defrost the evaporators. "Fan" is shown on the display.
- 2 at the second activation the fans are also stopped and the appliance can now be cleaned. "OFF" is shown on the display.
- 3 At the third activation refrigeration is recommenced. The display will show the actual appliance temperature, (o97 setting).

When appliance cleaning is activated a cleaning alarm is transmitted to the normal alarm recipient. A later processing of these alarms will document that the appliance has been cleaned as often as planned.

Alarm monitoring

There are no temperature alarms during appliance cleaning.

E-_	**	+	:-000
-	+	+	°C
1	÷	+	Fan
2	÷	÷	Off
3	+	+	°C

Defrost

Depending on the application you may choose between the following defrost methods:

Natural: Here the fans are kept operating during the defrost

Electric: The heating element is activated

Hotgas: Here the solenoid valves are controlled so that the

hotgas can flow through the evaporator

Defrost sequence

- 1) Pump down
- 2) Defrost
- 3) Waiting position after defrost
- 4) Draining (drain delay. Hotgas only)
- 5) Drip off
- 6) Delay of fan

Hot gas defrost (application 6 only)

This type of connection can be used on systems with hotgas defrost, but only in small systems in, say, supermarkets – the functional content has **not** been adapted to systems with large charges

Relay 2 is used for suction valve

Relay 4's change-over function can be used by the bypass valve and/or the hotgas valve.

Must not be used together with PMLX and GPLX valves, unless a time delay relay is installed, which ensures that the PMLX/GPLX valve is closed completely before the hotgas is turned on.

Drip tray heating element

It is possible to control a heating element in the drip tray for hot gas defrosting. When defrosting is commenced, the heating element is activated. The heating element remains activated until a set time after defrosting has ended by time or temperature.

Start of defrost

A defrost can be started in different ways

Interval: Defrost is started at fixed time intervals, say, every eighth hour. An interval must ALWAYS be set to a "higher" value than the period set between two defrostings when a schedule or network signal is used.

Refrigeration time: Defrost is started at fixed refrigeration time intervals, in other words, a low need for refrigeration will "postpone" the defrost

Schedule: Here defrost can be started at fixed times of the day and night. However, max. 6 times

Contact: Defrost is started with a contact signal on a digital input Network: The signal for defrost is received from a system unit via the data communication

Adaptive defrost: Here defrosting is started based on intelligent registering of evaporator performance.

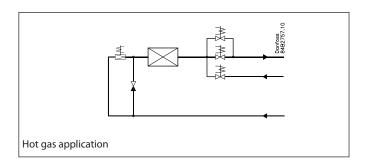

Manual: An extra defrost can be activated from the controller's lower-most button

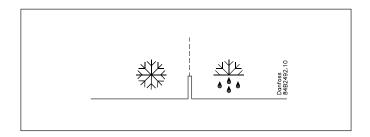

All the mentioned methods can be used at random – if just of them is activated a defrost will be started.

Stop of defrost

Defrosting can be stopped by either:

- Time
- Temperature (with time as safety).

Coordinated defrost

There are two ways in which coordinated defrost can be arranged. Either with wire connections between the controllers or via data communication

Wire connections

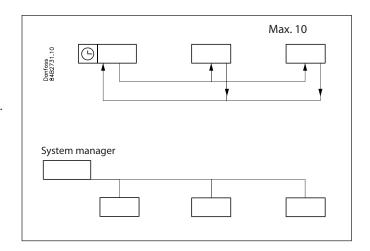

The digital input DI2 is connected between the current controllers. When one controller starts a defrost all the other controllers will follow suit and likewise start a defrost. After the defrost the individual controllers will move into waiting position. When all are in waiting position there will be a change-over to refrigeration.

Coordination via data communication

Here the system unit handles the coordination.

The controllers are gathered in defrosting groups and the system unit ensures that defrosting is started in the group according to a weekly schedule.

When a controller has completed defrosting, it sends a message to the system unit and then goes into a waiting position. When every controller in the group is in a waiting position, refrigeration is again permitted in all the individual controllers.

Defrost on demand

- 1 Based on refrigeration time
 - When the aggregate refrigeration time has passed a fixed time, a defrost will be started.
- 2 Adaptive defrosting based on monitoring of evaporator performance

This function is based on a registration of the air flow through the evaporator. By using the AKV valve as mass flowmeter for the refrigerant flow it is possible to compare the energy input on the refrigerant side with the energy output on the air side. Via this comparison the air flow through the evaporator can be determined and hence also the amount of ice/frost build-up on the evaporator surface. If the ice/frost build-up reduces the capacity of the evaporator the function will carry out an additional defrost.

Enter in the weekly defrost schedule the number of defrosts corresponding to the basic load. If the load of the evaporator is increased beyond this, defrost on demand will add the required additional defrosts.

The function requires the following connections:

- Expansion valve type AKV
- Temperature signal from both S3 and S4
- Temperature signal from the condensing pressure Pc which is to be distributed via the network from the system manager.

NOTE. The S3 and S4 sensors must be placed in the air flow/channel immediately before/after the evaporator.

Min. time between defrosts

There is a 2 hours minimum time between defrosts.

This avoids that planned defrosts in accordance with the weekly schedule are carried out immediately after a defrost on demand has been carried out. The time applies from when a defrost on demand has been completed to when a planned defrost is again permitted. The defrost on demand will not start defrosting with a shorter interval than the 2 hours either.

Reset

If the adaptive defrost function registers problems with the defrost, it will show an error message and the function will no longer carry out extra defrosts. In this event a manual reset of the function via d22 should be carried out.

When the reset function is activated it will start a defrost so that the subsequent tuning will take place on an evaporator with no ice/frost build-up.

Note

The function "Adaptive defrost" should only be activated when the evaporator runs under normal operational conditions.

Melting function

This function will stop the air flow in the evaporator from being reduced by frost created by uninterrupted operation for a long time. The function is activated if the thermostat temperature has remained in the range between -5°C and +10°C for a longer period than the set melting interval. The refrigeration will then be stopped during the set melting period. The frost will be melted so that the air flow and hence the evaporator's capacity will be greatly improved.

Real-time clock

The controller has a built-in real-time clock which can be used to start defrosts. This clock has a power reserve of four hours. If the controller is equipped with data communication, the clock will automatically be updated from the system unit.

Control of two compressors

The two compressors must be of the same size. When the controller demands refrigeration it will first cut in the compressor with the shortest operating time. After the time delay the second compressor will be cut in.

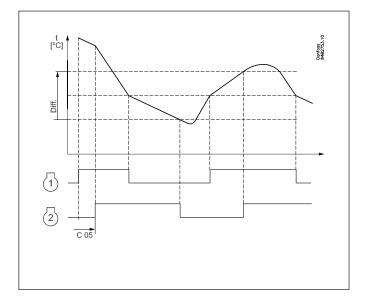

When the temperature has dropped to "the middle of the differential", the compressor with the longest operation time will be cut out.

The running compressor will continue until the temperature has reached the cutout value. Then it will cut out. When the temperature again reaches the middle of the differential, a compressor will again be started.

If one compressor cannot maintain the temperature within the differential, the second compressor will also be started. If one of the compressors has run on its own for two hours, the compressors will be changed over so that operational time is balanced.

The two compressors must be of a type that can start up against a high pressure.

The compressors's settings for "Min On time" and "Min Off time" will always have top priority during normal regulation. But if one of the override functions is activated, the "Min On time" will be disregarded.

Railheat

It is possible to pulse-control the power to the rail heat in order to save energy. Pulse control can either be controlled according to day/night load or dew point.

Pulse control according to day and night

Various ON periods can be set for day and night operation. A period time is set as well as the percentage part of the period in which the rail heat is ON.

Pulse control according to dew point

In order to use this function a system manager of the type AK-SM is required which can measure dew point and distribute the current dew point to the appliance controllers. For this the rail heat's ON period is controlled from the current dew point.

Two dew point values are set in the appliance control:

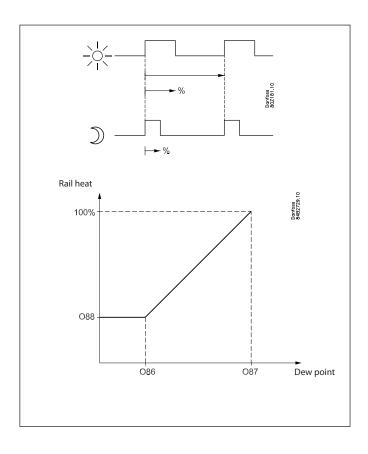

- \bullet One where the effect must be max. i.e.100%. (o87)
- One where the effect must be min. (o86).

At a dew point which is equal to or lower than the value in 086, the effect will be the value indicated in o88.

In the area between the two dew point values the controller will manage the power to be supplied to the rail heat.

During defrosting

During defrosting the rail heat will always be 100% ON.

Fan

Pulse control

To obtain energy savings it is possible to pulse control the power supply to the fans at the evaporators.

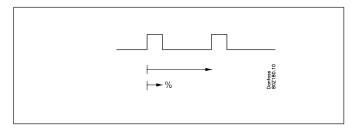

Pulse control can be accomplished in one of the following ways:

- during the thermostat's cutout period (cold room)
- during night operation and during the thermostat's cutout period (appliance with night lid)

A period of time is set as well as the percentage of this period of time where the fans have to be operating.

Cutout of fans during plant breakdowns

If the refrigeration in a breakdown situation stops, the temperature in the cold room may rise quickly as a result of the power supply from large fans. In order to prevent this situation the controller can stop the fans if the temperature at S5 exceeds a set limit value.

Light function

The function can be used for controlling the light in a refrigeration appliance or in a cold room. It can also be used for controlling a motorised night blind.

The light function can be defined in three ways:

- the light is controlled via a signal from a door contact. Together with this function a time delay can be set so that the light is kept on for a period of time after the door has been closed.
- the light is controlled via the day/night function
- the light is controlled via the data communication from a system unit.

Here there are two operational options if data communication should fail:

- The light can go ON
- The light can stay in its current mode.

The light load must be connected to the NC switch on the relay. This ensures that the light remains on in the appliance if power to the controller should fail.

The light is switched off when "r12" (Main switch) is set to off (see o98).

The light is switched off when the appliance cleaning function is activated.

Night blind

Motorised night blind can be controlled automatically from the controller. The night blinds will follow the status of the light function. When the light is switched on, the night blinds opens and when the light is switched off, the night blinds close again. When the night blinds are closed, it is possible to open them using a switch signal on the digital input. If this input is activated, the night blinds will open and the refrigeration appliance can be filled with new products. If the input is activated again, the blinds close again.

When the night blind function is used, the thermostat function can control with different weighting between the S3 and S4 sensors. A weighting during day operation and another when the blind is closed.

A night blind is open when the appliance cleaning function is activated.

A setting can define that the night blind is open when "r12" (Main switch) is set to off (see o98).

Digital inputs

There are two digital inputs DI1 and DI2 with contact function and one digital input DI3 with high voltage signal.

They can be used for the following functions:

- Retransmission of contacts position via data communication
- Door contact function with alarm
- Starting a defrost
- Main switch start/stop of cooling
- Night setback
- Thermostat bands switch
- General alarm monitoring
- Case cleaning
- Forced cooling
- Override of night blinds
- Coordinated defrost (DI2 only)
- Forced closing of valve (DI 3 only)

Forced closing

The AKV valves can be closed with an external signal ("Forced closing").

The function must be used in connection with the compressor's safety circuit, so that there will be no injection of liquid into the evaporator when the compressor is stopped by the safety controls. (However not at low pressure – LP).

If a defrost cycle is in progress, the forced closing status will not be re-established until the defrost is completed.

The signal can be received from the DI3-input or via the data communication.

During a forced closing the fans can be defined to be stopped or in operation.

Door contact

The door contact function can via the digital inputs be defined for two different applications:

Alarm monitoring

The controller monitors the door contact and delivers an alarm message if the door has been opened for a longer period than the set alarm delay.

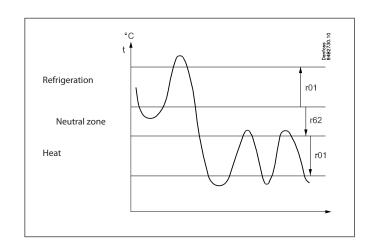

Alarm monitoring and stop of refrigeration

When the door is opened the refrigeration is stopped, i.e. the injection, the compressor and the fan are stopped and light switch on.

If the door remains open for a longer time than the set restart time, refrigeration will be resumed. This will ensure that refrigeration is maintained even if the door is left open or if the door contact should be defective. If the door remains open for a longer period than the set alarm delay an alarm will also be triggered.

Heating function

The heating function is used to prevent the temperature becoming too low, e.g. in a cutting room, etc. The limit for when the heating function cuts off is set as an offset value under the current cutout limit for the refrigeration thermostat. This ensures that refrigeration and heating do not occur simultaneously. The difference for the heating thermostat has the same value as for the refrigeration thermostat. To prevent that the heating thermostat cuts in during short-term drops in air temperature a time delay can be set for when to change from refrigeration to heating.

Data communication

The controller has fixed built-in MODBUS data communication.

If there is a requirement for a different form of data communication, a Lon RS 485 module can be inserted in the controller.

The connection must then be to terminal RS 485.

(To use a Lon RS 485 module and gateway type AKA 245 the module must be Version 6.20 or higher.)

Display

The controller has one plug for a display. Here display type EKA 163B or EKA 164B (max. length 15m) can be connected. EKA 163B is a display for readings.

EKA 164B is both for readings and operation.

The connection between display and controller may be with a cable which has a plug at both ends.

If the distance between display and controller is greater than 15 m, the connection must take another form.

An extra module must also be mounted in the controller if data communication is used.

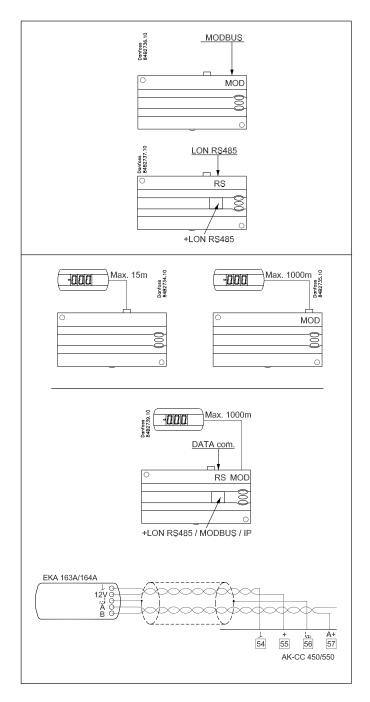

The built-in MODBUS data communication is used so that the display connection and the data communication to the other controllers must take place via a module. The module can be: Lon RS 485 or MODBUS.

When a display is to be connected to the built-in MODBUS, the display can advantageously be changed to one of the same type, but with Index A (version with screw terminals).

If connection of two displays is required, one must be connected to the plug (max. 15 m) and the other must then be connected to the fixed data communication.

Important

All connections to the data communication MODBUS and RS 485 must comply with the requirements for data communication cables. See literature: RC8AC.

Override

The controller contains a number of functions which can be used together with the override function in the master gateway/system manager.

Function via data communication	Function in gateway/system manager	Used parameters in AK-CC 550
Start of defrosting	Defrost control / Time schedule / Defrost group	Def start
Coordinated defrost	Defrost control / Defrost group	HoldAfterDef / DefrostState
Prevent defrost start		Disable Def
Day/Night schedule	Day/Night control / Time schedule / Light zone	Night setback
Light control	Day/Night control / Time schedule	O39 light Remote
Forced closing	Forced Close / Injection ON / AKC ON	Forced cl.
Forced cooling		Forced cool
Railheat link to dew point	/ Enhanced railheat	Dew point
P0 optimization	P0 Optimization	The controller supports P0 optimization
Adaptive defrost	/ Adaptive defrost. System manager only	Tc TempMean

Applications

Here is a survey of the controller's field of application.

A setting will define the relay outputs so that the controller's interface will be targeted to the chosen application.

On page 20 you can see the relevant settings for the respective wiring diagrams.

S3 and S4 are temperature sensors. The application will determine whether either one or the other or both sensors are to be used. S3 is placed in the air flow before the evaporator. S4 after the evaporator.

A percentage setting will determine how the control is to be based. S5 is a defrost sensor and is placed on/in the fins of the evaporator. S6 is a product sensor, but in application 9 and 10 it has a different use. DI1, DI2 and DI3 are contact functions that can be used for one of the following functions: door function, alarm function, defrost start, external main switch, night operation, change of thermostat reference, appliance cleaning, forced refrigeration or coordinated defrost. DI3 has a 230 V input. See the functions in settings 002, 037and 084.

General:

The ten uses are all adapted for commercial refrigeration systems in the form of either refrigeration appliances or cold storage rooms. In general all have outputs for:

- AKV valve
- Fan
- Defrost

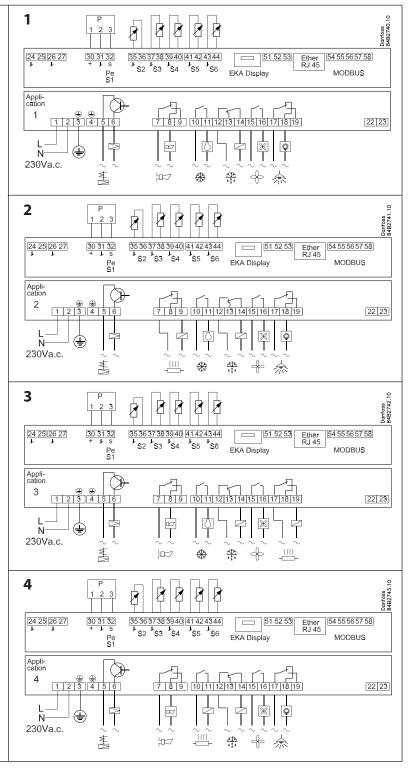

In addition they have different uses and thereby input and outputs.

Application 1-4

Standard applications.

This is for standard use where the vital difference is only different combinations of the following functions/outputs:

- Alarm
- Rail heat
- Compressor
- Light

The following uses have some special functions which in brief are:

Application 5

"Two-compressor" operation.

The two compressors must be of the same size. On start-up (after defrosting, operational stop, etc.) both compressors are started with a set time shift. One compressor starts at half the differential so that an optimum adaptation of compressor capacity takes place for the current load in the appliance/room. There is automatic runtime equalisation between the compressors. For a more detailed description please refer to earlier sections in the manual.

Application 6

Hot gas defrosting.

Hot gas defrosting is adapted to commercial appliances/rooms with limited system filling. One relay controls the main valve in the suction line.

A changeover relay controls both the hot gas valve and the drain valve.

This means that there is no time delay between stops of hot gas and start of draining.

Application 7

Control of night blinds

Night blinds follow the status of the light function – when the light is switched on, the night blinds are up and when the light is switched off, the night blinds are down. In addition a digital input provides the option of forced opening of the blinds so that the appliance can be filled with products.

Application 8

Heat thermostat

The heat thermostat is typically used if the temperature is to be controlled within narrower limits, e.g. for cutting rooms, etc. The heating thermostat can be set as a difference in relation to the cutout limit for the refrigeration thermostat so that simultaneous refrigeration and heating are avoided.

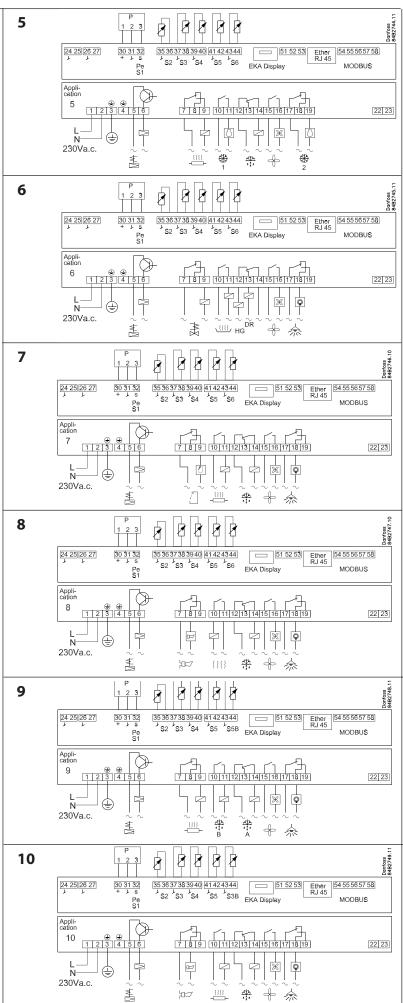

Application 9

Two refrigeration sections – two defrost outputs This application is for refrigeration appliances with one valve, two evaporators and two refrigeration sections. The temperature is controlled and is always alarm monitored according to the S4 temperature. For this the product sensor is used as a defrosting stop sensor for evaporator no. 2.

Application 10

Two refrigeration sections – individual alarm/display via S3

This application is for refrigeration appliances with one valve, one evaporator and two refrigeration sections. The temperature is always controlled according to the S4 temperature. The product sensor is used as an extra S3 sensor for section no. 2. Alarm monitoring and display readings take place individually via the "S3" sensors in each refrigeration section.

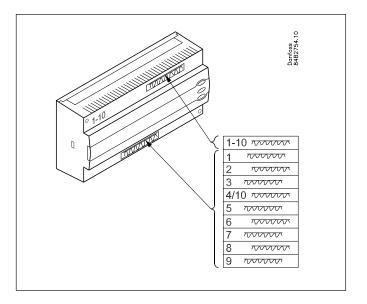

Connection signs

The controller is provided with signs from the factory indicating application 1

If you employ another use, signs are provided so that you can mount the relevant one. It is only the lower sign that needs to be mounted.

The number is indicated on the left-hand side of the signs. Use the sign with the current application number. One of the signs applies to both applications 4 and 10.

Survey of functions

Function	Para- meter	Parameter by operation via data communication
Normal display		
Normally the temperature value from one of the two thermostat sensors S3 or S4 or a mixture of the two measurements is displayed. In o17 the ratio is determined.		Display air (u56)
Thermostat		Thermostat control
Set point Regulation is based on the set value plus a displacement, if applicable. The value is set via a push on the centre button. The set value can be locked or limited to a range with the settings in r02 and r 03. The reference at any time can be seen in "u91 Cutout temp".		Cutout °C
Differential When the temperature is higher than the reference + the set differential, the compressor relay will be cut in. It will cut out again when the temperature comes down to the set reference. Ref. Dif.	r01	Differential
Setpoint limitation The controller's setting range for the setpoint may be narrowed down, so that much too high or much too low values are not set accidentally - with resulting damages.		
To avoid a too high setting of the setpoint, the max. allowable reference value may be lowered.	r02	Max cutout °C
To avoid a too low setting of the setpoint, the min. allowable reference value may be increased.	r03	Min cutout °C
Correction of the display's temperature If the temperature at the products and the temperature received by the controller are not identical, an offset adjustment of the display temperature can be carried out.	r04	Disp. Adj. K
Temperature unit Set here if the controller is to show temperature values in °C or in °F.	r05	Temp. unit °C=0. / °F=1 (Only °C on AKM, whatever the setting)
Correction of signal from S4 Compensation possibility due to long sensor cable	r09	Adjust S4
Correction of signal from S3 Compensation possibility due to long sensor cable	r10	Adjust S3
Start / stop of refrigeration With this setting refrigeration can be started, stopped or a manual override of the outputs can be allowed. (For manual control the value is set at -1. Then the AKV outlet and the relay outlets can be force-controlled by the respective reading parameters (u23, u58, etc.). Here the read value can be overwritten.) Start / stop of refrigeration can also be accomplished with the external switch function connected to a DI input.	r12	Main Switch 1: Start 0: Stop -1: Manual control of outputs allowed
Stopped refrigeration will give a "Standby alarm". Night setback value The thermostat's reference will be the setpoint plus this value when the controller changes over to night operation. (Select a negative value if there is to be cold accumulation.)	r13	Night offset
Thermostat function Here it is defined how the thermostat is to operate. Either as an ordinary ON/OFF thermostat or as a modulating thermostat. 1: ON/OFF thermostat 2: Modulating When operation is "modulating" the AKV valve will limit the flow of refrigerant so that the temperature variation will be less than for the ON/OFF thermostat. The differential (r01) must not be set lower than 2K for "modulating". In a decentralised plant you must select the ON/OFF thermostat setting.	r14	Therm. mode
Selection of thermostat sensor Here you define the sensor the thermostat is to use for its control function. S3, S4, or a	r15	Ther. S4 %
combination of them. With the setting 0%, only S3 is used (Sin). With 100%, only S4. Melt function Only for control of refrigeration (-5 to +10°C). The function ensures that the evaporator will not be blocked by frost. Here you set how often the function is to stop the refrigeration and hence transform the frost to water (or ice if there is too much frost).	r16	MeltInterval
Melt period Here you set how long an on-going melt function is to last.	r17	Melt period

The thermostar's cutout value when the thermostat band 2 is activated via a digital linguit. Correction of signal from 56 Selection of thermostat sensor 54% during night operation with night bilinds Selection of thermostat sensor 54% during night operation with night bilinds Selection of thermostat sensor 54% during night operation with night bilinds Hear function The start of the sensor the themestat is to use for its control function 53, 54, or a Hear function The delay on transition from refrigeration phase to heating phase. (there is not time delay on transition from refrigeration phase to refrigeration phase). (by the controller can give alarm in different situations. When there is an alarm all the light-centriting diodes (LED) will flash on the controller front panel, and the alarm relay will cut in. Alarm delay (short alarm delay on air temperature) If the upper or the lower alarm limit values are exceeded, a timer function will commence. The alarm will not become active until the set time delay has been passed. The time delay for coording diona glam delay This time delay for coording diona glam delay This time delay is used during start-up, during defrost, immediately after a defrost. There will be change-over to the normal time delay (A03) when the temperature has dropped below the set upper alarm limit. The time delay is set in minutes. Upper alarm limit Lower alarm limit for 56 temperature at thermostat 1 Lower alarm limit for 56 temperature at thermostat 1 Lower alarm limit for 56 temperature at thermostat 1 Lower alarm limit for 56 temperature at thermostat 1 Lower alarm limit for 56 temperature at thermostat 2 (Thermostat band 2) Same functions of the delay is a set on the maximum value.) Delay of a Dit alarm A cut-out/out-in input will result in alarm when the time delay has been passed. The function is defined in only a set of minimum and the part of the function is defined in only a set of minimum and the part of the function is defined in only a set of the minimum and			
Correction of signal from 56 Compensation possibility due to long sensor cable		r21	Cutout2 temp
Here you define the sensor the thermostat is to use for its control functions, 33, 4, or a combination of them. With the setting 08, only 35 is used (Sim.) With 100%, only 54. Heat function Set the size of the Neutral Zone for changeover from cooling to heating Time delay on transition from refrigeration phase to heating phase. (there is not time delay on transition from heating phase to refrigeration phase). Refreches to the Neutral Zone for changeover from cooling to heating phase. (there is not time delay on transition from heating phase to refrigeration phase). Refreches to the Neutral Zone for changeover from cooling to heating phase. (there is not time delay on transition from heating phase to refrigeration phase). Refreches to the Cooling of the Cooling of Cooling (Start of forced cooling) Forced close (Start of forced cooling) Forced close (Forced stop of cooling) Alarm He controller can give alarm in different situations. When there is an alarm all the light emitting diddes (LED) will flash on the controller front panel, and the alarm relay will cut in. Alarm delay (short alarm delay on air temperature) If the upper or the lower alarm limit values are exceeded, a timer function will commence. The alarm will not become active until the set time delay has been passed. Compressor		Compressor control
The compressor relay works in conjunction with the thermostat. When the thermostat calls for refrigeration the compressor relay be operated.		,
Running times To prevent irregular operation, values can be set for the time the compressor is to run once it has been started. And for how long it at least has to be stopped.		
The running times are not observed when defrosts start.		
Min. ON-time (in minutes)	c01	Min. On time
Min. OFF-time (in minutes)	c02	Min. Off time
Time delay for couplings of two compressors Settings indicate the time that has to elapse from the first relay cuts in and until the next relay has to cut in.	c05	Step delay
The LED on the controller's front will show whether refrigeration is in progress.		Comp Relay Here you can read the status of the compressor relay.
Defrost		Defrost control
The controller contains a timer function that is zeroset after each defrost start. The timer function will start a defrost if/when the interval time is passed. The timer function starts when voltage is connected to the controller, but it is displaced the first time by the setting in d05. If there is power failure the timer value will be saved and continue from here when the power returns. This timer function can be used as a simple way of starting defrosts, but it will always act as safety defrost if one of the subsequent defrost starts is not received. The controller also contains a real-time clock. By means of settings of this clock and times for the required defrost times, defrost can be started at fixed times of the day. Defrost start can also be accomplished via data communication, via contact signals or manual start-up. All starting methods will function in the controller. The different functions have to be set, so that multiple defrosts are avoided Defrost can be accomplished with electricity, hotgas or brine. The actual defrost will be stopped based on time or temperature with a signal from a temperature sensor. Defrost method Here you set whether defrost is to be accomplished with electricity, gas, or (none). During defrost the defrost relay will be cut in.	d01	Def. method 0 = non 1 = El 2 = Gas Def. Stop Temp
The defrost is stopped at a given temperature which is measured with a sensor (the sensor is defined in d10). The temperature value is set.		
Interval between defrost starts The function is zeroset and will start the timer function at each defrost start. When the time has expired the function will start a defrost. The function is used as a simple defrost start, or it may be used as a safeguard if the normal signal fails to appear. If master/slave defrost without clock function or without data communication is used, the interval time will be used as max. time between defrosts. If a defrost start via data communcation does not take place, the interval time will be used as max. time between defrosts. When there is defrost with clock function or data communication, the interval time must be set for a somewhat longer period of time than the planned one, as the interval time will otherwise start a defrost which a little later will be followed by the planned one. In connection with power failure the interval time will be maintained, and when the power returns the interval time will continue from the maintained value. The interval time is not active when set to 0.	d03	Def Interval (0=off)
Max. defrost duration This setting is a safety time so that the defrost will be stopped if there has not already been a stop based on temperature or via coordinated defrost.	d04	Max Def. time
Time staggering for defrost cutins during start-up The function is only relevant if you have several refrigeration appliances or groups where you want the defrost to be staggered in relation to one another. The function is furthermore only relevant if you have chosen defrost with interval start (d03). The function delays the interval time d03 by the set number of minutes, but it only does it once, and this at the very first defrost taking place when voltage is connected to the controller. The function will be active after each and every power failure.	d05	Time Stagg.

Drip-off time Here you set the time that is to elapse from a defrost and until the compressor is to start again. (The time when water drips off the evaporator).	d06	DripOff time
Delay of fan start after defrost Here you set the time that is to elapse from compressor start after a defrost and until the fan may start again. (The time when water is "tied" to the evaporator).	d07	FanStartDel
Fan start temperature The fan may also be started a little earlier than mentioned under "Delay of fan start after defrost", if the defrost sensor S5 registers a lower value than the one set here.	d08	FanStartTemp
Fan cut in during defrost Here you can set whether fan is to operate during defrost. 0: Stopped (Runs during pump down) 1: Running (stopped during "fan delay") 2: Running during pump down and defrost. After that stopped	d09	FanDuringDef
Defrost sensor Here you define the defrost sensor. 0: None, defrost is based on time 1: S5 2: S4 3: Sx. For application 1 to 8 and 10 defrosting is stopped when both S5 and S6 have reached the set temperature. For application 9 defrosting is stopped individually on the two sections of S5 / S5B	d10	DefStopSens.
Pumpdown delay Set the time where the evaporator is emptied of refrigerant prior to the defrost.	d16	Pump dwn del.
Drain delay (only in connection with hotgas) Set the time where the evaporator is emptied of condensed refrigerant after the defrost.	d17	Drain del
Defrost on demand – aggregate refrigeration time Set here is the refrigeration time allowed without defrosts. If the time is passed, a defrost will be started. With setting = 0 the function is cut out.	d18	MaxTherRunT
Delay on stop of heating in the drip tray The time applies from the time the defrost stops by time or temperature to the time the heating element in the drip tray needs to be disconnected.	d20	Drip Tray del
Adaptive defrosting An adaptive defrosting is an extra defrost in addition to the scheduled defrosts. Here the adaptive defrost is set for when it can start a defrost if the need arises: 0: Never 1: Only alarm on ice over 2: It may only start during day operation 3: It may start both during day and night operation 4: It can only start during night operations	d21	AD mode
Restart of adaptive defrosting The function starts a defrost and when it is complete, the tuning function restarts so that the evaporator's data can be registered. MUST ONLY BE ACTIVATED DURING STANDARD OPERATION. If you wish to see the temperature at the defrost sensor, push the controller's lower-	d22	AD reset Defrost temp.
most button. (May be changed to another function in o92.) If you wish to start an extra defrost, push the controller's lowermost button for four		Def Start
seconds. You can stop an ongoing defrost in the same way		Here you can start a manual defrost
		Hold After Def Shows ON when the controller is operating with coordinated defrost. Disable def.
		Defrost in progress can be stopped
		Defrost State Status on defrost 1= pump down / defrost
Parameter for cooling function		
Integration time Expert setting for injection function The value should only be changed by specially trained staff.	n05	Tn sec
Max. value for the superheat reference	n09	Max SH
Min. value for the superheat reference	n109	Min SH
MOP temperature	n11	MOP temp
If no MOP function is required, select pos. OFF Temperatureglide (only when using of S1-temperature sensor)	n12	(A value of 15 corresponds to OFF)
If a zeotrope refrigerant is used, a value for temperature glide must be set.	1112	Gilde

AKV valve's time period in seconds Should only be set to a lower value if it is a decentralised plant and the suction pressure fluctuates a lot and in line with the opening of the AKV valve.	n13	AKV Period
Startup time for signal reliability If the controller does not obtain a reliable S1 signal within this period of time it will in other ways try to create a stable signal. (A too high value may result in a flooded evaporator). The value should only be changed by specially trained staff.	n15	StartUp time
Average opening degree The controller continuously registers the valve's opening degree and uses the value in its regulation.	n16	AKV Dim.
The value should only be changed by specially trained staff. Signal reliability at startup The regulation uses the value as start value for the valve's opening degree for each thermostat cutin. In connection with adaptive control the controller continuously calculates a new value. The value should only be changed by specially trained staff.	n17	Start OD %
Stability factor for regulation of superheat (Stability) With a higher value the control function will allow a greater fluctuation of the superheat before the reference is changed. The value should only be changed by specially trained staff. (Factory setting = 4.0)	n18	-
Ampflication factor Expert setting for injection function The value should only be changed by specially trained staff.	n23	MTR Kp factor
Integration time Expert setting for injection function The value should only be changed by specially trained staff.	n24	MTR Tn sec
Choice of sensor for superheat function (can only be set if "r12" = 0) 1: Pressure transmitter type AKS 32R 2: Temperature sensor S1 (Pt1000 Ohm at 0°C)	n57	Pe/S1 select
Fan		Fan control
Fan stop temperature The function stops the fans in an error situation, so that they will not provide power to the appliance. If the defrost sensor registers a higher temperature than the one set here, the fans will be stopped. There will be re-start at 2 K below the setting. The function is not active during a defrost or start-up after a defrost. With setting 150% the function is interrupted.	F04	FanStopTemp.
With setting +50°C the function is interrupted. Pulse operation of fan 0: No pulse operation 1: Pulse operation when the thermostat does not call for refrigeration 2: Pulse operation when the thermostat does not call for refrigeration, but only during night operation	F05	Fan Pulse Mode
Pulse operation period for fan Here the overall pulse time is set. The sum of ON-to and OFF time.	F06	Fan cycle
ON time for fan Here the % part of the period the fans are to be in operation is set.	F07	Fan ON %
The LED on the controller's front will indicate whether a defrost is going on.		Fan Relay Here you can read the fan relay status, or force-control the relay in "Manual control" mode.
Real time clock		
When using data communication the clock is automatically adjusted by the system unit. If the controller is without data communication, the clock will have a power reserve of four hours.		(Times cannot be set via data communication. Settings are only relevant when there is no data communication).
Real-time clock You can set up to six individual times for defrost starts for each 24-hour period. There is also a date indication used for registration of temperature measurements.		
Defrost start, hour setting	t01-t06	
Defrost start, minute setting (1 and 11 belong together, etc.) When all t01 to t16 equal 0 the clock will not start defrosts. Clock: Hour setting	t11-t16	
Clock: Minute setting	t08	
Clock: Date setting	t45	
Clock: Month setting	t46	
Clock: Year setting	t40	
		<u> </u>

Miscellaneous		Miscellaneous
Delay of output signal after start-up	o01	DelayOfOutp.
After start-up or a power failure the controller's functions can be delayed so that overloading of the electricity supply network is avoided. Here you can set the time delay.		
Digital input signal - DI1 The controller has a digital input 1 which can be used for one of the following functions:	o02	DI 1 Config. Definition takes place with the numerical value shown to the left.
Off: The input is not used		
1) Status display of a contact function 2) Door function. When the input is open it signals that the door is open. The refrig-		(0 = off)
eration and the fans are stopped and light switched on. When the time setting in		
"A04" is passed, an alarm will be given and refrigeration will be resumed (089). 3) Door alarm. When the input is open it signals that the door is open. When the time		
setting in "A04" is passed, there will be alarm.		DI state
4) Defrost. The function is started with a pulse signal. The controller will register when the DI input is activated. The controller will then start a defrost cycle.		(Measurement) The DI input's present status is shown
5) Main switch. Regulation is carried out when the input is short-circuited, and regula-		here. ON or OFF.
tion is stopped when the input is put in pos. OFF. 6) Night operation. When the input is short-circuited, there will be regulation for		
night operation.		
7) Thermostat band changeover. Switch to thermostat 2 (r21). 8) Separate alarm function. Alarm will be given when the input is short-circuited.		
9) Separate alarm function. Alarm will be given when the input is opened. (For 8 and		
9 the time delay is set in A27) 10) Case cleaning. The function is started with a pulse signal. See also description on		
page 5.		
11) Forced refrigeration at hotgas defrost when the input is short-circuited. 12) Night cover		
If the controller is built into a network with data communication, it must have an		
address, and the master gateway of the data communication must then know this address.		
The address is set between 0 and 240 depending on the system unit and the selected	-02	-
The address is set between 0 and 240, depending on the system unit and the selected data communication. If the system unit is gateway type AKA 245, the version must be	o03	
6.20 or higher.		
The address is sent to the gateway when the menu is set in pos. ON IMPORTANT: Before you set o04, you MUST set o61. Otherwise you will be transmit-	o04	
ting incorrect data.		
(The function is not used when the data communication is MODBUS)	-05	Acc. code
Access code 1 (Access to all settings) If the settings in the controller are to be protected with an access code you can set a	o05	Acc. code
numerical value between 0 and 100. If not, you can cancel the function with setting 0.		
(99 will always give you access). Sensor type for S3, S4, S5, S6	006	SensorConfig
Normally a Pt 1000 sensor with great signal accuracy is used. But you can also use a		Pt = 0 PTC = 1
sensor with another signal accuracy. That may either be a PTC sensor (1000 ohm at 25°C)		PIC=I
All the mounted sensors S3-S6 must be of the same type. Max. standby time after coordinated defrost	016	Max HoldTime
When a controller has completed a defrost it will wait for a signal which tells that the	010	wax noid fille
refrigeration may be resumed. If this signal fails to appear for one reason or another, the controller will itself start the refrigeration when this standby time has elapsed.		
Select signal for the display S4%	o17	Disp. S4%
Here you define the signal to be shown by the display. S3, S4, or a combination of the two.		
With setting 0% only S3 is used. With 100% only S4.		
Pe. Working range for pressure transmitter - min. value	020	MinTransPres
Pe. Working range for pressure transmitter - max. value	021	MaxTransPres
Refrigerant setting (only if "r12" = 0) Before refrigeration is started, the refrigerant must be defined. You may choose between the following refrigerants	o30	Refrigerant
1=R12. 2=R22. 3=R134a. 4=R502. 5=R717. 6=R13. 7=R13b1. 8=R23. 9=R500.		
10=R503. 11=R114. 12=R142b. 13=Userdefined. 14=R32. 15=R227. 16=R401A. 17=R507. 18=R402A. 19=R404A. 20=R407C. 21=R407A. 22=R407B. 23=R410A.		
24=R170. 25=R290. 26=R600. 27=R600a. 28=R744. 29=R1270. 30=R417A.		
31=R422A Warning: Wrong selection of refrigerant may cause damage to the compressor.		
Other refrigerants: Here Setting 13 is selected and then three factors -Ref.Fac a1, a2 and a3 - via AKM must be set.		

Digital input signal - D2 The controller has a digital input 2 which can be used for one of the following func-	o37	DI2 config.
tions: Off: The input is not used.		
1) Status display of a contact function		
2) Door function. When the input is open it signals that the door is open. The refrig-		
eration and the fans are stopped. When the time setting in "A04" is passed, an alarm		
will be given and refrigeration resumed. (o89).		
3) Door alarm. When the input is open it signals that the door is open. When the time		
setting in "A04" is passed an alarm will be given.		
4) Defrost. The function is started with a pulse signal. The controller will register when the DI input is activated. The controller will then start a defrost cycle. If the signal		
is to be received by several controllers it is important that ALL connections are		
mounted the same way (DI to DI and GND to GND).		
5) Main switch. Regulation is carried out when the input is short-circuited, and regula-		
tion is stopped when the input is put in pos. OFF.		
6) Night operation. When the input is short-circuited, there will be regulation for night operation.		
7) Thermostat band changeover. Switch to thermostat 2 (r21)		
8) Separate alarm function. Alarm will be given when the input is short-circuited.		
9) Separate alarm function. Alarm will be given when the input is opened.		
10) Case cleaning. The function is started with a pulse signal. See also description on		
page 5. 11) Forced refrigeration at hotgas defrost when the input is short-circuited.		
12) Night blinds. When the input is short-circuited the night blinds will be activated.		
13) The input is used for coordinated defrost in conjunction with other controllers of		
the same type		
Configuration of light function	o38	Light config
Light is controlled via day/night status Light is controlled via data communication and "Light remote o39"		
3) Light is controlled by door contact, defined in either o02, o37 or o84 where the set-		
ting is selected to either 2 or 3. When the door is opened the relay will cut in. When		
the door is closed again there will be a time delay of two minutes before the light is		
switched off.		
4) As "2" but if there are any 15-minute network errors, the light will switch on and the night blind will open.		
Activation of light relay	o39	Light remote
The light relay can be activated here, but only if defined in o38 with setting 2.

Digital input signal - DI3 (high voltage input)	o84	DI3 config.
The controller has a digital input 3 which can be used for one of the following func-		
tions:		
Off: The input is not used.		
1) Status display of 230 V signal		
2) Door function. When the input is 0 V it signals that the door is open. The refrigera-		
tion and the fans are stopped. When the time setting in "A04" is passed, an alarm		
will be given and refrigeration resumed. (o89)		
3) Door alarm. When the input is 0 V it signals that the door is open. When the time		
setting in "A04" is passed an alarm will be given.		
4) Defrost. The function is started with a pulse signal. (puls on 230 V)		
5) Main switch. Regulation is carried out when the input is 230 V, and regulation is		
stopped when the input is 0 V.		
6) Night operation. When the input is 230 V, there will be regulation for night opera-		
tion.		
7) Thermostat band changeover. Switch to thermostat 2 (r21)		
8) Not used.		
9) Not used.		
10) Case cleaning. The function is started with a pulse signal (pulse on 230 V). See also		
description on page 5.		
11) Forced refrigeration at hotgas defrost when the input is 230 V.		
12) Night cover		
13) Not used		
14) Cooling stopped with the function "Forced closing"		
Rail heat control	085	Railh. mode
The rail heat can be controlled in several ways:	303	
0: The function is not used		
1: Pulse control is used with a timer function following the day/night operation (o41		
and o42)		
2: Pulse control is used with a dew point function. This function requires that a signal		
is received about the dew point value. The value is measured by a system manager		
and sent to the controller via the data communication.		
Dew point value where the rail heat is minimum	086	DewP Min lim
This function is discussed earlier in the manual.	000	Dewr Milli IIII
	07	2 2 4 1:
Dew point value where the rail heat is maximum	o87	DewP Max lim
This function is discussed earlier in the manual.		
Lowest permitted rail heat effect	088	Rail Min ON%
Here the % part of the effect to be achieved when the dew point value is minimum.

Status on input DI3 (on/1 = 230 V)	u87	DI3 status
Readout of the actual cutin value for the thermostat	u90	Cutin temp.
Readout of the actual cut out value for the thermostat	u91	Cutout temp.
Status on function "Adaptive defrost" 0: Off. Function is not activated 1: Error. A reset must be carried out using d22 2: Reset is activated. New tuning is in progress 3: Normal 4: Light build-up of ice	U01	AD state
5: Medium build-up of ice 6: Heavy build-up of ice		

^{*)} Not all will be displayed. Only the function belonging to the selection application is displayed.

Operating status		(Measurement)
The controller goes through some regulating situations where it is just waiting for the next point of the regulation. To make these "why is nothing happening" situations visible, you can see an operating status on the display. Push briefly (1s) the upper button. If there is a status code, it will be shown on the display. The individual status codes have the following meanings:		Ctrl. state: (Shown in all menu displays)
Normal regulation	S0	0
Waiting for end of the coordinated defrost	S1	1
When the compressor is operating it must run for at least x minutes.	S2	2
When the compressor is stopped, it must remain stopped for at least x minutes.	S3	3
The evaporator drips off and waits for the time to run out	S4	4
Refrigeration stopped by main switch. Either with r12 or a DI-input	S10	10
Refrigeration stopped by thermostat	S11	11
Defrost sequence. Defrost in progress	S14	14
Defrost sequence. Fan delay — water attaches to the evaporator	S15	15
Refrigeration stopped due to open ON input or stopped regulation	S16	16
Door is open. DI input is open	S17	17
Melt function in progress. Refrigeration is interrupted	S18	18
Modulating thermostat control	S19	19
Emergency cooling due to sensor error	S20	20
Regulation problem in the injections function	S21	21
Start-up phase 2. Evaporator being charged	S22	22
Adaptive control	S23	23
Start-up phase 1. Signal reliability from sensors is controlled	S24	24
Manual control of outputs	S25	25
No refrigerant selected	S26	26
Case cleaning	S29	29
Forced cooling	S30	30
Delay on outputs during start-up	S32	32
Heat function r36 is active	S33	33
Other displays:		
The defrost temperature cannot be displayed. There is stop based on time	non	
Defrost in progress / First cooling after defrost	-d-	
Password required. Set password	PS	
Regulation is stopped via main switch	OFF	

^{*)} Emergency cooling will take effect when there is lack of signal from a defined S3 or S4 sensor. The regulation will continue with a registered average cutin frequency. There are two registered values – one for day operation and one for night operation.

Fault message

In an error situation the LED's on the front will flash and the alarm relay will be activated. If you push the top button in this situation you can see the alarm report in the display.

There are two kinds of error reports - it can either be an alarm occurring during the daily operation, or there may be a defect in the installation.

A-alarms will not become visible until the set time delay has expired.

E-alarms, on the other hand, will become visible the moment the error occurs.

(An A alarm will not be visible as long as there is an active E alarm).

Here are the messages that may appear:

Code / Alarm text via data communication	Description	Alarm relay groups (P41)
A1/ High t.alarm	High temperature alarm	1
A2/ Low t. alarm	Low temperature alarm	2
A4/ Door alarm	Door alarm	8
A5/ Max hold time	The "o16" function is activated during a coordinated defrost	16
A10/ Inject prob.	Control problem	64
A11/ No Rfg. sel.	No refrigerant selected	64
A13/ High temp S6	Temperature alarm. High S6	1
A14/ Low temp S6	Temperature alarm. Low S6	2
A15/ DI1 alarm	DI1 alarm	8
A16/ DI2 alarm	DI2 alarm	8
A45/ Standby mode	Standby position (stopped refrigeration via r12 or DI input)	-
A59/ Case clean	Case cleaning. Signal from DI input	-
A74/ AD fault	Error in the adaptive defrost function	16
A75/ AD Iced	Evaporator is iced up. Reduction of air flow	16
A76/ AD not defr.	Defrost of evaporator is not satisfactory	16
E1/ Ctrl. error	Faults in the controller	32
E6/ RTC error	Change battery and check clock	32
E20/ Pe error	Error on pressure transmitter Pe	64
E23/ S1 error	Error on S1 sensor	4
E24/ S2 error	Error on S2 sensor	4
E25/ S3 error	Error on S3 sensor	4
E26/ S4 error	Error on S4 sensor	4
E27/ S5 error	Error on S5 sensor	4
E28/ S6 error	Error on S6 sensor	4
E37/ S5 error B	Error on S5B sensor	4
/ Max Def.Time	Defrost stopped based on time instead of, as wanted, on temperature	16

Data communication

The importance of individual alarms can be defined with a setting. The setting must be carried out in the group "Alarm destinations"

Settings from	Settings from	Log		Alarm relay		Send via
System manager	AKM (AKM destination)		Non	High	Low-High	Network
High	1	X		X	X	Χ
Middle	2	X			X	Χ
Low	3	X			X	Χ
Log only		X				
Disabled						

Operation

Display

The values will be shown with three digits, and with a setting you can determine whether the temperature is to be shown in $^{\circ}\text{C}$ or in $^{\circ}\text{F}$

Light-emitting diodes (LED) on front panel

The LED's on the front panel will light up when the relevant relay is activated.

Refrigeration

= Defrost

= Fan running

The light-emitting diodes will flash when there is an alarm. In this situation you can download the error code to the display and cancel/sign for the alarm by giving the top button a brief push.

The buttons

When you want to change a setting, the upper and the lower buttons will give you a higher or lower value depending on the button you are pushing. But before you change the value, you must have access to the menu. You obtain this by pushing the upper button for a couple of seconds - you will then enter the column with parameter codes. Find the parameter code you want to change and push the middle buttons until value for the parameter is shown. When you have changed the value, save the new value by once more pushing the middle button.

Examples

Set menu

- 1. Push the upper button until a parameter r01 is shown
- 2. Push the upper or the lower button and find that parameter you want to change
- 3. Push the middle button until the parameter value is shown
- 4. Push the upper or the lower button and select the new value
- 5. Push the middle button again to freeze the value.

Cutout alarm relay / receipt alarm/see alarm code

A short press of the upper button
 If there are several alarm codes they are found in a rolling stack.

 Push the uppermost or lowermost button to scan the rolling stack.

Set temperature

- 1. Push the middle button until the temperature value is shown
- 2. Push the upper or the lower button and select the new value
- 3. Push the middle button again to conclude the setting.

Reading the temperature at defrost sensor (Or product sensor, if selected in 092.)

• A short press of the lower button

Manuel start or stop of a defrost

· Push the lower button for four seconds.

Get a good start

With the following procedure you can start regulation very quickly:

- 1 Open parameter r12 and stop the regulation (in a new and not previously set unit, r12 will already be set to 0 which means stopped regulation.)
- 2 Select electrical connection based on the drawings on page 12 and 13
- **3** Open parameter o61 and set the electric connection number in it
- 4 Now select one of the preset settings from the table on page 27.
- **5** Open parameter o62 and set the number for the array of presettings. The few selected settings will now be transferred to the menu.
- **6** Open parameter n57 and select method for measuring of evaporator pressure Pe or S1 (factory setting is Pe pressure transmitter)
- 7 If pressure transmitter Pe is used you must select refrigerant via parameter o30
- 8 Open parameter r12 and start the regulation
- **9** Go through the survey of factory settings. The values in the grey cells are changed according to your choice of settings. Make any necessary changes in the respective parameters.
- 10 For network. Set the address in o03
- 11 Send address to system unit:
 - MODBUS: Activate scan function in system unit
 - If another data communication card is used in the controller:
 - LON RS485: Activate the function o04

Auxiliary schedule for settings (quick-setup)

		Case			Room				
	Defrost stop on time		st stop 1 S5	Defrost stop on time	Defrost stop on S5

DI1

Digital input signal.

The defined function is active when the input is short-circuited/opened. The function is defined in o02.

DI2

Digital input signal.

The defined function is active when the input is short-circuited/opened. The function is defined in o37.

Pressure transmitter or temperature sensor S1

Pe / AKS 32R (pressure measurement recommended)

Connect to terminal 30, 31 and 32.

The signal from one pressure transmitter can be received by up to 10 controllers. But only if there are no significant pressure decreases between the evaporators to be controlled.

S1 (correct location is important to ensure correct measurements)
Pt 1000 ohm sensor

Connect to terminal 31 and 32.

S2

Pt 1000 ohm sensor

S3, S4, S5, S6

Pt 1000 ohm sensor or PTC 1000 ohm sensor. All have to be of the same type.

S3, air sensor, placed in the warm air before the evaporator

S4, air sensor, placed in the cold air after the evaporator (the need for either S3 or S4 can be deselected in the configuration)

S5, defrost sensor, placed on the evaporator

*S6, product sensor or defrost sensor B or air sensor B.*The configuration determines which.

EKA Display

If there is be external reading/operation of the controller, display type EKA 163B or EKA 164B can be connected.

RS485 (terminal 51, 52, 53)

For data communication, but only if a data communication module is inserted in the controller. The module can be a LON RS485 or a MODBUS.

Terminal 51 = screen

Terminal 52 = A (A+)

Terminal 53 = B (B-)

(For LON RS485 and gateway type AKA 245 the gateway must be version 6.20 or higher.)

RJ45

For data communication, but only if a TCP/IP module is inserted in the controller. (OEM specific)

MODBUS

For data communication.

Terminal 56 = screen

Terminal 57 = A+

Terminal 58 = B-

(Alternatively the terminals can be connected to an external display type EKA 163A or 164A, but then they cannot be used for data communication. Any data communication must then be carried out by one of the other methods.)

Supply voltage

230 V a.c.

DO1

Connection of expansion valve type AKV or AKVA. The coil must be a **230 V a.c. coil.**

DO2

Alarm

There is a connection between terminal 7 and 8 in alarm situations and when the controller is without power.

Rail heat and heating element in drip tray

There is connection between terminal 7 and 9 when heating takes place.

Night blind

There is connection between terminal 7 and 9 when the night blind is up.

Suction line valve

There is connection between terminal 7 and 9 when the suction line must be open.

DO3

Refrigeration, Rail heat, Heat function, Defrost 2

There is connection between terminal 10 and 11 when the function must be active.

Heating element in drip tray

There is connection between terminal 10 and 11 when heating takes place.

DO4

Defrost

There is connection between terminal 12 and 14 when defrosting takes place.

Hot gas / drain valve

There is connection between terminal 13 and 14 during normal operation.

There is connection between terminal 12 and 14 when the hot gas valves must open.

DO5

Far

There is connection between terminal 15 and 16 when the fan is on.

D06

Light relay

There is connection between terminal 17 and 18 when the light must be on.

Rail heat, Compressor 2

There is connection between terminal 17 and 19 when the function must be active.

DI3

Digital input signal.

The signal must have a voltage of 0 / 230 V AC.

The function is defined in 084.

Data communication

If data communication is used, it is important that the installation of the data communication cable is performed correctly. See separate literature No. RC8AC...

Electric noise

Cables for sensors, DI inputs and data communication **must** be kept separate from other electric cables:

- Use separate cable trays
- Keep a distance between cables of at least 10 cm
- Long cables at the DI input should be avoided

Installation considerations

Accidental damage, poor installation, or site conditions, can give rise to malfunctions of the control system, and ultimately lead to a plant breakdown.

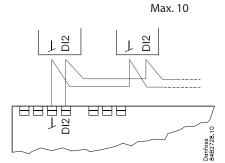

Every possible safeguard is incorporated into our products to prevent this. However, a wrong installation, for example, could still present problems. Electronic controls are no substitute for normal, good engineering practice.

Danfoss will not be responsible for any goods, or plant components, damaged as a result of the above defects. It is the installer's responsibility to check the installation thoroughly, and to fit the necessary safety devices.

Special reference is made to the necessity of signals to the controller when the compressor is stopped and to the need of liquid receivers before the compressors.

Your local Danfoss agent will be pleased to assist with further advice, etc.

Coordinated defrost via cable connections

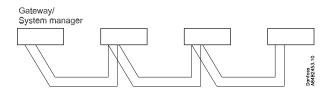

The following controllers can be connected up in this way:

EKC 204A, AK-CC 210, AK-CC 250, AK-CC 450, AK-CC 550,

Refrigeration is resumed when all controllers have "released" the signal for defrost.

Coordinated defrost via data communication

The setting of controllers to coordinate their defrosting takes place in the gateway/system manager.

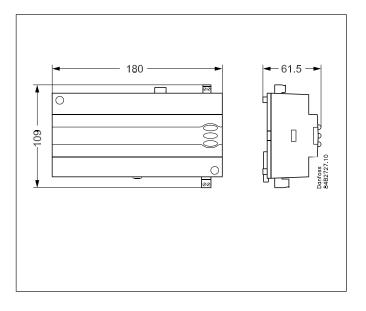

Refrigeration is resumed when all controllers have "released" the signal for defrost.

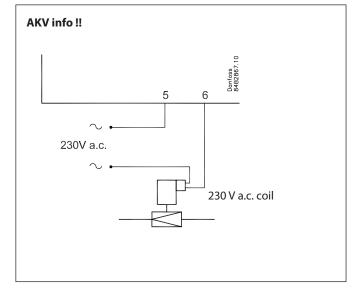

Data

Supply voltage	230 V a.c. +10/-15	%. 5 VA, 50/60 H	Z					
Sensor S2, (S1)	Pt 1000							
Sensor S3, S4, S5, S6	Pt 1000 or PTC 1000 ohm / 2 (All 4 must be of t
